

Operating system

This guide focuses on Fedora Server but should be applicable to many distributions with minor tweaks. CentOS or Ubuntu Server or would also work just as well.

- Don't create a swap partition on these machines
- Make sure ntp is enabled for accurate time
- Make sure the VMs have static IPs or DHCP reservations, so their IPs won't change

Snap

Snap is a package manager that contains MicroK8s. It comes preinstalled on Ubuntu, but if you're on CentOS, Fedora or others, you'll need to install it on all your nodes:

<https://snapcraft.io/docs/installing-snap-on-centos>

```
sudo dnf -y install epel-release
sudo dnf -y install snapd
sudo systemctl enable --now snapd
sudo ln -s /var/lib/snapd/snap /snap
```
